OUTCOMES

As of September 2022
Real, measurable impact

100% of nominating professionals who return their evaluations report an improvement in their patient’s ability to cope with cancer.

- 48% increase in the patient’s coping ability
- 43% increase in the caregiver’s coping ability
- 51% increase in the children’s coping ability
“Susan admits she struggles with anxiety during treatment. Susan stated that this respite really allowed her to relax and not think about her cancer. Susan's spouse felt the same, enjoying themselves as they did pre-cancer.”—Maryellen, Social Worker

237 pre and post healthcare provider evaluations returned.

Susan at Woodloch, April 2022
Real, life-changing experiences

After completing a respite, virtually all patients agreed or strongly agreed with the following statements:

- I am better equipped to return home emotionally
- I am better equipped spiritually to return home
- I feel this respite has strengthened my relationship with my spouse
- I feel this respite has strengthened my relationship with my children
- I feel this respite has strengthened my relationship with my community of FPS families
- I am better able to communicate with my spouse as a result of this respite
- I am better able to communicate with my children as a result of this respite
- I am better prepared emotionally to continue my treatment protocol prescribed by my oncologist
- I feel the time spent with other families on this respite helped me cope with my current situation
- This respite has positively impacted my outlook on life with cancer
An unexpected moment that brought Vidalizza joy on respite was, “Having my kids take part in activities without being asked.” — Vidalizza Padilla, Woodloch April 2022 (passed away July, 2022)

155 patient evaluations returned

Real, life-changing *experiences*

After completing a respite, virtually all patients agreed or strongly agreed their current concerns in life were decreased:

- Decreased concern with ability/noticeability to work
- Decreased concern with returning to work
- Decreased concern for general finances
- Decreased concern with cost of medical treatment
- Decreased concern with future treatment
- Decreased concern with uncertainty of future
- Decreased concern with mortality
- Decreased concern related to pain
- Decreased concern with the care and wellbeing of family members
- Decreased concern with communication within the family
### Data from Patient Pre and Post Respite Survey

#### Most Concern

- **Ability/Inability to work**
- **Returning to work**
- **General finances**
- **Cost of Medical Treatment**
- **Future Treatment**
- **Uncertainty of Future**
- **Mortality**
- **Pain**
- **Care of Family Members**
- **Wellbeing of Family Members**
- **Communication within the Family**

#### No Concern

- **Pre Respite Survey**
- **Post Respite Survey**

100% REDUCED CONCERN POST RESPITE
159 patient surveys completed

Pre and Post survey concerns statement relative to the stressors during the cancer journey.

The lower the number the less concern, these percentages demonstrate the decrease in the concern post respite compared to pre respite.
Real, life-changing experiences

After completing a respite, virtually all caregivers agreed or strongly agreed their current concerns in life were decreased:

- Decreased concern with ability/inability to work
- Decreased concern with returning to work
- Decreased concern for general finances
- Decreased concern with cost of medical treatment
- Decreased concern with future treatment
- Decreased concern with uncertainty of future
- Decreased concern with mortality
- Decreased concern related to pain
- Decreased concern with the care and wellbeing of family members
- Decreased concern with communication within the family
REDUCED CONCERN POST RESPITE
155 caregiver surveys completed

Pre and Post survey concerns statement relative to the stressors during the cancer journey.

The lower the number the less concern, these percentages demonstrate the decrease in the concern post respite compared to pre respite.
